Farm performance

Organization: Maya Grower's organization

Report type: farm_performance

Generated: 11 Nov 2026 21:47 UTC

Period: 2026-10-13 to 2026-11-11

Overview

Provenance: observed

Per-field activity over the selected period: observations ingested, active recommendations, crop cycles started, and precipitation-derived water volumes.

Key figures

Label	Value	Unit	Provenance
Farms in scope	0	count	observed
Fields in scope	—	count	missing
Total area	—	ha	missing
Period length	30	days	observed

Field breakdown

Provenance: missing

Per-field activity counts for the selected period.

Note: No fields in scope.

Field	Area (ha)	Observations (count)	Active recommendations (count)	Crop cycles (count)
No data available for this section in the selected period.				

Water

Provenance: missing

Water plans created in the period and precipitation-derived volumes. Irrigation metering is not implemented platform-wide.

Note: No water plans and no precipitation observations in this period.

Key figures

Label	Value	Unit	Provenance
Precipitation volume (model-derived)	—	m3	missing
Irrigation volume	—	m3	missing

Data quality

Provenance: missing

Observation counts by recorded quality status within the period.

Note: No observations ingested in this period.

Quality status	Observations (count)
No data available for this section in the selected period.	

Provenance legend

observed: Measured platform data.

model_derived: Computed by a documented formula from observed inputs.

simulated: Synthetic fixture data — always labelled.

missing: The platform does not hold the required data.

Assumptions

• Water volumes derive from precipitation observations × registered field area (1 mm over 1 ha = 10 m³); effective rainfall is NOT deducted.

• Period filters use observation timestamps compared in UTC.

• Field areas are the user-registered geometry areas, not surveyed values.

Limitations

• Yield, input costs and profit are not recorded by the platform and are never estimated in this report.

• Irrigation volumes are not metered platform-wide; water figures derive from precipitation observations only.

• PDF v1 contains no charts — tables and key figures only.

• This report summarizes platform data; it is not an agronomic or financial certification.

Sources

• observations — data-platform provider ingests

• crop_history — farmer records

• AI recommendations — platform engines (rules / rules+llm)

• water plans — seasonal water intelligence snapshots

• soil measurements — laboratory and farmer-reported samples
